

# AEGIS

# Introduction to Aegis

Aegis is a solution that tackles safety concerns during travelling

It asks for user's travel details and a picture or number of the vehicle

Users set a time period and receive push notification alerts

Emergency contacts are notified if user doesn't respond to alerts

# How Aegis Works

- Users provide details of their travel destinations and mode of transport
- A picture or number of the vehicle is also required
- Users set a time period for continuous safety checkins
- Push notification alerts are sent to users at regular intervals

# Emergency Response

Emergency contacts can activate emergency mode to alert authorities

If user doesn't respond to alerts twice, emergency contacts are notified

Coordinates and details of the user are sent to the nearest police station

Emergency contacts receive similar alerts about user's unresponsiveness
